

## ABSTRACT OF THE DISCLOSURE

2 The apparatus is a self propelled trailer with a bin with closed sides and a tailgate  
3 for collecting waste material directly as it is stripped from a building and dumping the  
4 material into a nearby vehicle. The entire bin can be moved out beyond the rear of the  
5 trailer and raised to the level as high as the eaves of a roof by the use of hydraulic pistons.  
6 The trailer can be moved under its own power to a dump truck; and, with the bin raised; the  
7 tailgate is opened and the bin is tilted rearward to dump its load over the side of a truck.  
8 Large hinged extension flaps at the top of the sides are held at an angle sloping into  
9 the bin to approximately double the "catch" area of the bin and prevent material  
10 from falling to the ground.
